Introduction

Ribonuclease protection assay (RPA) is a highly sensitive and specific method to detect and quantitate RNAs. The method is based on the hybridization of a target RNA to either a ³²P- or biotin labeled anti-sense RNA probe *in vitro* transcribed from a DNA template. RNase treatment follows, resulting in degradation of single-stranded RNA and excess probe.

In the radioactive approach, the probe and target RNA are resolved by denaturing polyacrylamide gel electrophoresis and the “protected” probe is visualized using autoradiography or beta imaging equipment.

In our new non-radioactive approach, biotin-labeled probe is hybridized, in excess, to target RNA in solution. Following hybridization, free probe and other single-stranded RNA are digested with RNases. The remaining “RNase-protected” probes are purified, resolved on denaturing polyacrylamide gels, then transferred to a positively-

charged nylon membrane. The membrane is probed and the signal quantified using Streptavidin-HRP and the enhanced chemiluminescent substrate provided in the kit. The membrane is exposed to either X-ray film or a CCD camera and the level of each mRNA species in the original RNA sample is determined based on the intensity of the appropriately-sized, protected probe fragment.

The Multi-Probe RPA is made possible by generating a series of templates, each of a different length and each representing a sequence in a distinct mRNA species. The templates are assembled into biologically relevant sets and used for the T7 polymerase-directed synthesis of a high-specificity, biotin-labeled, anti-sense RNA probe set.

Each template set is capable of detecting up to 12 unique gene messages in addition to two housekeeping genes, L32 and GAPDH.

The multi-probe RPA approach has the distinct advantages of sensitivity and the capacity to simultaneously quantify several mRNA species in a single sample of total RNA. This allows comparative analyses of different mRNA species within samples and, by incorporating a probe for a housekeeping gene transcript, the levels of individual mRNA species can be compared between samples. Moreover, the assay is highly specific and quantitative due to the RNase sensitivity of mismatched base pairs and the use of solution-phase hybridization driven toward completion by excess probe. Lastly, the Multi-Probe RPA can be performed on total RNA preparations derived by standard methods from either cultured cells or frozen tissues, without further purification of poly-A⁺ RNA.

BD RiboQuant™ RNase Protection Assay System Advantages:

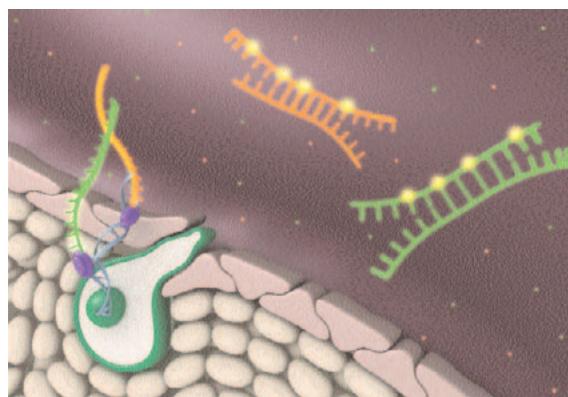

- Easy, multiplexed quantification of mRNA
- Uses non-radioactive biotin-labeled probes
- Highly specific
 - High-stringency hybridizations
 - Comparisons within and between mRNA species
- Highly sensitive:
 - Solution-phase hybridization at probe excess
 - Stability of RNA hybrids
 - Linear signal over broad input RNA range
- Uses total RNA from cells or tissues

Unparalleled range of specificities available

We offer over 100 pre-assembled, biologically relevant Multi-Probe Template Sets and over 1000 specific templates from which to choose.

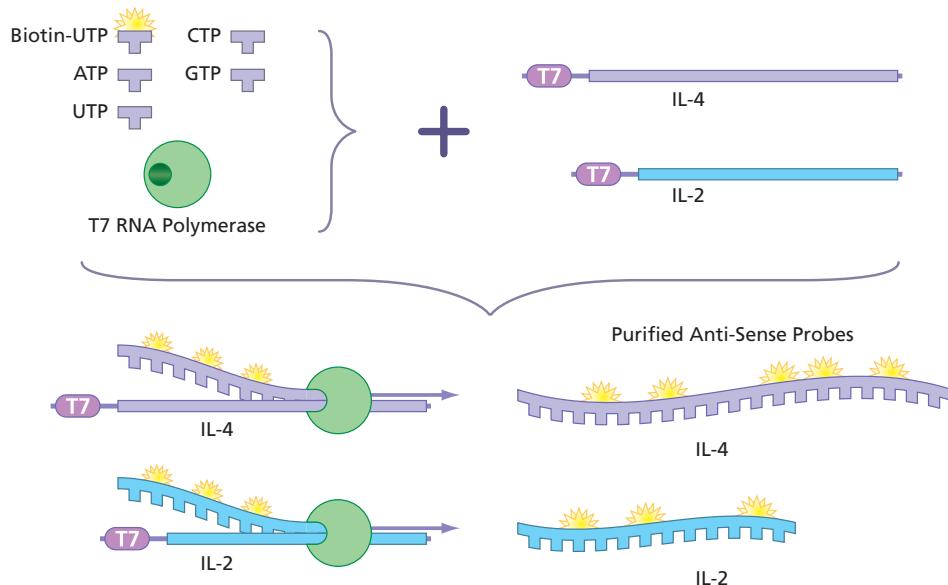

Custom Template Assembly and Design

We also offer custom template construction and/or assembly to meet your needs.

Non-Radioactive RNase Protection Assay for Multiplexed Quantification of Differentially Expressed Genes

The new version of the BD RiboQuant™ Ribonuclease Protection Assay (RPA) offers a non-radiolabeled (Non-Rad) approach to this powerful and versatile system. Multi-Probe RPA has traditionally been performed using probes labeled by the incorporation of [32P]-UTP to provide optimal signal and sensitivity. By using our new kit to generate non-radiolabeled probes for Multi-Probe RPA, risks associated with exposure to radioactivity, environmental concerns and regulatory requirements are eliminated. With our non-radioactive kits, researchers can now choose which system best suits their needs.

The BD RiboQuant™ Non-Rad RPA System includes:

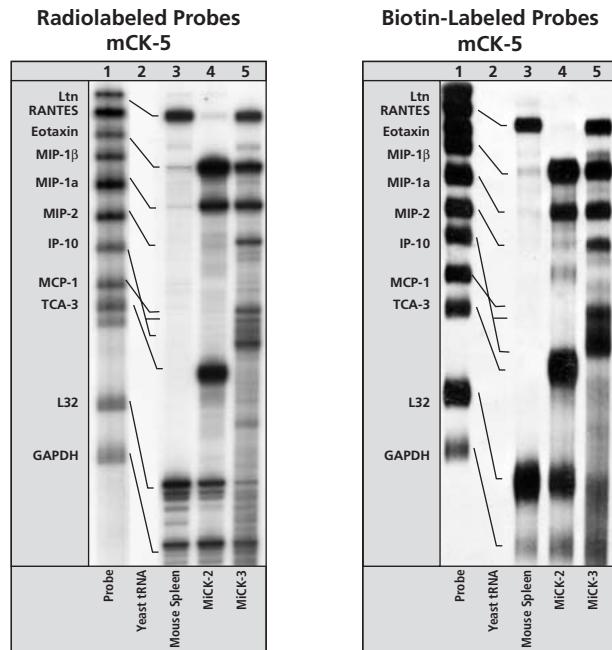

- Multi-Probe Template Sets
- BD RiboQuant Non-Rad In Vitro Transcription Kit* (Cat. No. 551917)
- BD RiboQuant RPA Kit (Cat. No. 556134)
- BD RiboQuant Non-Rad Detection Kit (Cat. No. 551918)
- BD RiboQuant Non-Rad Starter Package† (Cat. No. 551919)

BD RiboQuant Non-Rad In Vitro Transcription Kit

The BD RiboQuant Non-Rad *In Vitro* Transcription Kit is optimized for the efficient synthesis of high specific-activity, biotin-labeled riboprobes from the BD Pharmingen™ Multi-Probe Template Sets. Each kit contains sufficient reagents for 5 transcription reactions, yielding ~10 µg biotin-labeled probe per reaction.

BD RiboQuant Non-Rad Detection Kit

The BD RiboQuant Non-Rad Detection Kit includes 10 positively-charged nylon membranes and all reagents necessary for signal development using enhanced chemiluminescence.

mCK-5 Cat. No. 556146

Template	Probe	Protected
Ltn	390	361
RANTES	349	321
Eotaxin	314	285
MIP-1β	285	257
MIP-1α	256	228
MIP-2	231	205
IP-10	210	181
MCP-1	190	163
TCA-3	171	143
L32	141	112
GAPDH	125	97

Non-Rad vs. Radiolabeled RPA using mCK-5.

RPA was performed using 10 µg total RNA from various cell populations. Lane 3) untreated mouse spleen. Lane 4) Purified CD4+ splenocytes (BALB/c) were stimulated with anti-mouse CD3 and anti-mouse CD28, and cultured with purified mouse IL-2 and mouse IL-4, followed by restimulation with PMA + ionomycin (MiCK-2). Lane 5) 3-day thioglycolate-elicited peritoneal cells (BALB/c) stimulated with purified mouse IFN-γ and LPS in the presence of a protein transport inhibitor (MiCK-3). (For complete stimulation protocols, please refer to Cytokines/Chemokines Application Manual, 3rd ed., BD Biosciences Pharmingen, June 1999, pp 31-32.)

* Biotinylated nucleotides must be purchased separately. BD RiboQuant non-radioactive RPA has been optimized with biotin-16-UTP available from Roche Biosciences.

† Individual kits or sets of the system may be purchased separately or together, with one Multi-Probe Template Set of choice, as the BD RiboQuant Non-Rad RPA Starter Package, Cat. No. 551919. All protocols are described in the newest edition of the BD RiboQuant Instruction Manual. Please contact your local BD Biosciences office.

BD RiboQuant™ Reagents and Kits

556850 BD RiboQuant™ In Vitro Transcription Kit

Kit Contents

556133	Ammonium Acetate	1.3 ml
556126	DTT	50 µl
556132	EDTA	650 µl
556125	GTP/ATP/CTP/UTP Pool	25 µl
556130	RNase-Free DNase	50 µl
556128	RNasin®*	25 µl
556129	T7 RNA Polymerase	25 µl
556127	Transcription Buffer	100 µl
556131	Yeast tRNA	50 µl

551917 BD RiboQuant™ Non-Rad In Vitro Transcription Kit

Kit Contents

5x Nucleotide Mix	16.5 µl
5x Transcription Buffer	20 µl
DTT	10 µl
Enzyme Mix (RNasin®* & T7 RNA Polymerase)	10 µl
RNase-free DNase I	10 µl
EDTA	135 µl
Glycogen	5 µl
LiCl	2.7ml

556134 RPA Kit

Kit Contents

556141	Ammonium Acetate	24 ml
556135	Hybridization Buffer	3.6 ml
556142	Loading Buffer	1.3 ml
556139	Proteinase K	300 µl
556138	Proteinase K Buffer	3.9 ml
556137	RNase A + T1 Mix	60 µl
556136	RNase Buffer	25 ml
556140	Yeast tRNA	300 µl

551918 BD RiboQuant™ Non-Rad Detection Kit

Kit Contents

Nylon Membranes	10
Hybridization Buffer	100 ml
Hybridization Stringency Wash Buffer	300 ml
Membrane Blocking Buffer	400 ml
Wash Buffer (4x)	400 ml
Substrate Equilibration Buffer	400 ml
Streptavidin-Horseradish Peroxidase	1.5 ml
Stable Peroxide Buffer	50 ml
Luminol / Enhancer	50 ml

556144 BD RiboQuant™ RPA Starter Package

Package Contents

556850	In Vitro Transcription Kit	1 Kit
556134	RPA Kit	1 Kit
	Choice of one BD RiboQuant™ Template Set	10 reactions

BD RiboQuant™ Custom Services

Custom Assembly of Template Sets

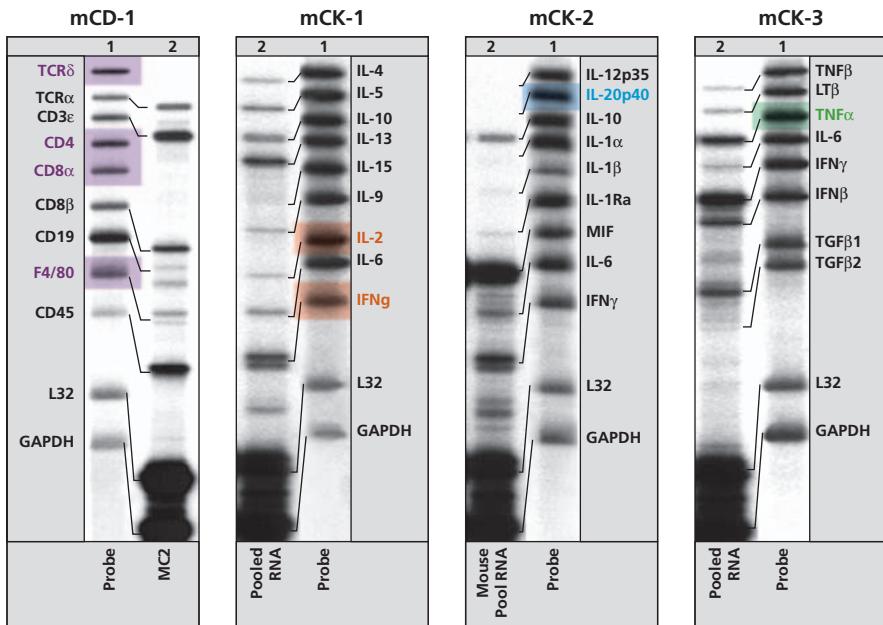

To ensure that your research needs are met, BD Biosciences Pharmingen makes the entire inventory of BD RiboQuant™ templates available for assembly into custom sets tailored to your individual experimental design. Custom Multi-Probe Template Sets can be assembled from any of the available templates, taking into consideration that each of the probes greater than 250 bp must differ by at least 25 nucleotides, and probes smaller than 250 bp by 12 nucleotides. The capacity of the system is 12 targets plus 2 housekeeping control genes. Please refer to the gene tables on pages 14-22 for the templates and probe sizes currently available.

An example of a research-specific custom set assembly.¹

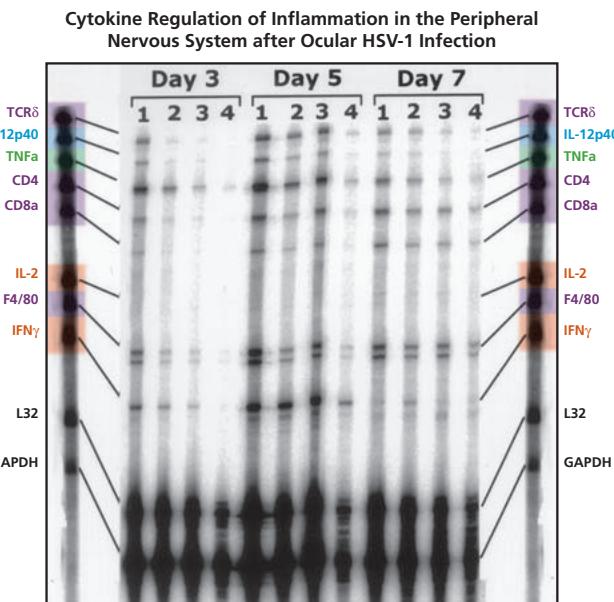

Ocular infection of Herpes Simplex Virus type-1 (HSV-1) in BALB/c mice results in transmission of the virus to the trigeminal ganglion, part of the peripheral nervous system. In the trigeminal ganglion the presence of viral antigens causes an inflammatory reaction which is mediated by leukocytes and cytokines. IFN γ and TNF α individually and in combination regulate the inflammatory reaction as evidenced by antibody neutralization experiments. The goal of this experiment was to monitor both cytokine gene expression and the effect of cytokines on leukocyte infiltration at the inflammatory site. Since the cytokine genes and the leukocyte-specific markers are not included in an existing Multi-Probe Template Set, a custom template set was designed for the detection of these specific genes. The Multi-Probe Template Set used in this study includes templates for mouse TCR δ , IL-12p40, TNF α , CD4, CD8 α , IL-2, F4/80 and IFN γ .

1. Kodukula P, Liu T, Van Rooijen N, Jager M., and Hendricks R. L. 1999. Macrophage control of Herpes Simplex Virus type 1 replication in the peripheral nervous system. *J. Immunol.* 162: 2895-2905

Existing Sets

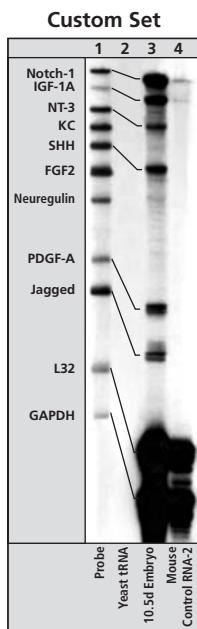

Custom Set using existing templates (see above)

Mice receiving different treatments: Control mAb (lane 1), anti-TNF α (lane 2), anti-IFN γ (lane 3) or anti-TNF α and anti-IFN γ (lane 4) were sacrificed 3, 5 and 7 days following HSV-1 infection. The trigeminal ganglion was dissected and total RNA extracted. RNase protection assay was performed using the custom template set. Shown above is an example of RPA data obtained by phosphorimager analysis.

Custom Cloning of Templates

In addition to our custom template assembly service, BD Biosciences Pharmingen also provides custom cloning. If a template is requested that is not in our inventory, we will design and generate the template based on available sequences. Using probe algorithms created at BD Biosciences, we select a region within the gene of interest that will provide optimal probe specificity. Using conventional cloning techniques, a template is generated, the sequence is confirmed, and the probe is tested by RPA. Custom templates may be assembled with appropriately-sized templates in a custom set.

Example of a custom template set where all genes were cloned and assembled according to the customer's request.

Custom RNase Protection Assay Services

The BD Biosciences Custom Products and Services Group (CPSG) provides RPA services for the detection and quantification of multiple mRNA species. Gene regulation in cultured cells and frozen tissue samples can be monitored for basic and clinical research studies.

Custom Services include:

RNA preparation and quantification.

RNA is isolated from samples using acid guanidinium thiocyanate-phenol-chloroform extraction. Total RNA is quantitated for use in RPA.

Probe synthesis, hybridization, and RNase treatment.

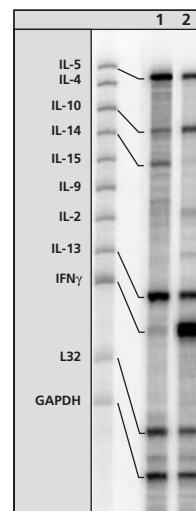

^{32}P -labeled, antisense RNA probes are generated from standard and customized BD RiboQuant Multi-Probe Template Sets and hybridized with target RNA. Free probe and other single-stranded RNA are digested with RNases.

Electrophoresis separation and autoradiogram.

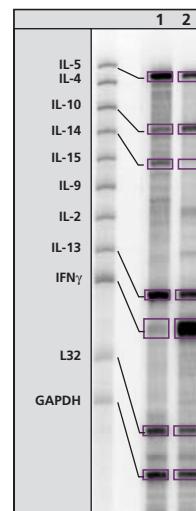

RNase protected probes are purified and resolved on denaturing polyacrylamide gels and developed on film. The expressed mRNA species are identified by the presence of bands corresponding to the expected fragment length.

Phosphorimaging quantification.

Radioactivity of ^{32}P -labeled probes are measured by phosphorimaging. The quantity of each mRNA species is determined based on the housekeeping genes L32 and GAPDH.

^{32}P -labeled anti-sense RNA probes hybridized to total RNA from samples 1 and 2 in RNase protection assay. Protected probes purified and resolved on denaturing polyacrylamide gel.

Selection of protected probes for quantitation of mRNA species detected by phosphorimaging. Quantitative comparison of cytokine mRNA levels in samples 1 and 2 based on intensity of ^{32}P -labeled probe fragments.
